*Your Protection Is
 Our Business*

Nsauditor Network Security Auditor is a network security scanner that allows to audit and monitor network computers for possible vulnerabilities, checks your network for all potential methods that a hacker might use to attack it. Nsauditor is a complete networking utilities package that includes more than 45 network tools for network auditing, scanning, monitoring and more. The product contains a built-in database of known network security vulnerabilities, which allows you to select the items for scanning and add custom entries.

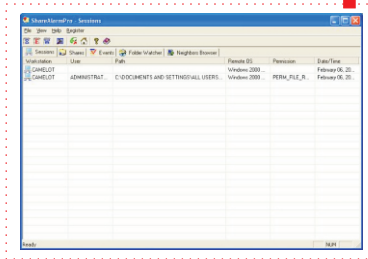

Network security requires constant care and monitoring. With Nsauditor Network Security Auditor, Systems Administrators are able to gather a wide range of information from all the computers in the network without installing server-side applications on these computers. It is a multi-purpose tool designed to scan networks and hosts for vulnerabilities, and to provide security alerts.

Nsauditor Network Security Auditor significantly reduces the total cost of network management in enterprise environments by enabling IT personnel to audit and monitor remote network computers for possible vulnerabilities. The software network auditor module checks network for all potential methods that a hacker might use to attack it, discovers network services and checks them for vulnerabilities.

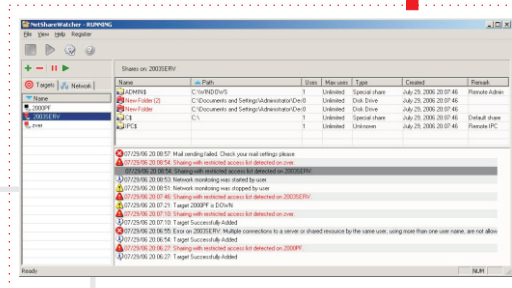

Nsauditor performs event log based intrusion detection, monitors the security event logs of Windows 2000/XP/2003 servers or workstations and notifies of the possible intrusions/attacks by using E-mail, Net Send, Speech Recognition method or by playing user selected voice file.

In summary, Nsauditor Network Security Auditor is a very complete network tools package for a surprisingly low price.

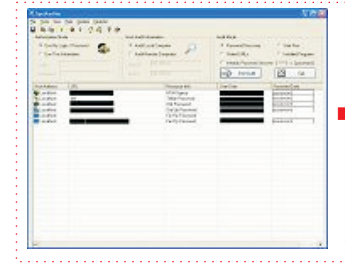

ShareAlarmPro is a network tool that allows network administrators and users easily perform a shared folders and resources monitoring. Using ShareAlarmPro you can monitor users attempting to access secured shares and confidential files, detect and log network access to shared folders, monitor security events, monitor accessed files, disconnect users from open files or deny network users access, monitor sharing permission changes.

NetShareWatcher is network security improvement software. It allows network administrators to monitor network shares and identify shares which are violating data access policy in their organization. You can configure it once and forget about network sharing problems. You need select restricted groups or users and every time when it will find network share with access list containing that restricted groups and will perform an configured action.

SpotAuditor is a Windows utility that offers administrators a comprehensive solution for recovering passwords and other critical business information stored in users' computers. Whether employees have unexpectedly left the company, or they have simply forgotten their passwords, SpotAuditor lets you recover confidential information stored in computers.

BlueAuditor is a easy-to-use program for detecting and monitoring Bluetooth devices in a wireless network. It can discover and track any Bluetooth device and display key information about each device being detected as well as the services device provided. BlueAuditor will enable network administrators to effectively audit their wireless networks against security vulnerabilities associated with the use of Bluetooth devices.
