Network Monitoring

Network monitoring is a tool that monitors network connections and processes (applications and services) currently running on the computer. This tool shows you detailed listings of all TCP and UDP endpoints of your system including owner process name, remote address and state of TCP connections.

The **Process** column shows the name of the program, the **Protocol** column shows the protocol type, the **Local Address** column shows the local Ip address, the **Local Port** column shows the local port, used with the specified process in the local computer, the Remote Address column shows the remote Ip address, if the specified process has an established connection with a remote computer and N/A otherwise, the **Remote Port** column shows the remote computer's port used for the process that has a connection with the specified process, and 0 if there is no connection with remote computer, the **State** column shows the connection state, the **Hostname** column shows the remote host name, the **Country** column shows the country, the **Service Name** column shows the service name, the **Service Description** column shows the description of the specified service.

The screenshot displays the Nsauditor Network Security Auditor interface. The main window shows a table of network connections with columns for Process, Protocol, Local Address, Local Port, Remote Address, Remote Port, State, Hostname, Country, and Service Name. A context menu is open over the selected row for process 'msmsgs.exe:860'. Below the main table, there is a 'Task' section showing active monitoring tasks like 'Netmon', 'LM Spider', and 'Scanner' with their respective progress bars and states.

Process	Proto...	Local Address	Local Port	Remote Addr...	Remote...	State	Hostname	Country	Cl...	Service Name	Service Description
inetinfo.exe:1280	TCP	0.0.0.0	21	N/A	0	Listening				ftp	file
inetinfo.exe:1280	TCP	0.0.0.0	25	N/A	0	Listening				smtp	sim

Task	Description	Progress	State	Level	Notify
Netmon	Network Monitoring	Netmon Running	MONITORING	Normal	Running
LM Spider	LM/NTLM Spider	Spider Running	RUNNING	Normal	Running
Scanner	Port Scanner	100%	SCANNING	Normal	Running

The bottom of the window contains information about tasks that are currently running. That information includes Task, Description, Progress, State, Level, Notify. You can switch from one task to another by selecting appropriate row.

Right- clicking on the window brings up a menu with the following commands:

Close Connection – closes the connection with selected process.

Close Process - terminates the process .

Process Properties – opens the Process Details dialog.

Who Is Remote Host – for TCP connections opens the **WhoIs resolver** dialog.

Trace Route Host - for TCP connections opens the **Tracert** dialog.

Abuse Address – shows the abuse address of remote host.

RBL Check - checks if the specified host is in a Real-time Black list for spammers “RBL “.

Advanced Information – opens **DataDisplay** dialog.

Save As – saves the data to the text file.

Copy Row – copies the selected row.

Copy All - copies all rows.

The DataDisplay dialog contains the following information: local port information, local port, service, service description.
