Email Validate

The Email Validate Tool is a client utility for checking the validity of an email account. The tool supports two modes;

VRFY - checks the validity of an account using SMTP VRFY command,

EXPN - is used to find the delivery address of mail aliases also full name of the recipients.

To start the validation process enter the Dns server in the **Dns Servers** field and the Email address in the **Email Address** field and click on the button Validate.

During the validation process you will get the warning that very secure email servers will not give any information.
