Enumerate Computers

Enumerate computers is a tool to enumerate computers in a domain. Depending on enumeration parameters the tool can work in different ways. It can enumerate all computers (if **All Computers** is selected), all SQL servers only (if **Microsoft SQL Servers** is selected), all primary domain controllers only (if **Primary domain controllers** is selected) , backup domain controllers only (if **Backup domain controllers** is selected), primary domains only (if **Primary domains** is selected), etc.

Computers Enumerate Dialog		\mathbf{X}
Enumerate Parameters		
All Computers Microsoft SQL Servers		Server running dial-in service
	Kenix servers	
Primary domain controllers (PDC)		Servers sharing print queue
Backup domain controllers (BDC)	Servers running Windows for Workgroups	☐ Microsoft File and Print for NetWare
Primary domains	LAN Manager workstation	Server clusters available in the domain
LAN Manager server	☐ Windows servers not a domain controller	Browser service
- <netserversehum> - <netmachine <br="" name="CAMELOT" platform="NT Platform" version="5.0">Comment=""> Service>LAN Manager workstation Service>LAN Manager server Service>Microsoft SQL Server Service>Windows NT/Windows 2000 workstation or server Service> </netmachine> </netserversehum>		
Enum Cancel		

You can enumerate different server types by selecting more than one type.

To start the process select the server types you want to enumerate and click on the **Enum** button.

The enumeration results will be displayed in XML format.

To close the dialog click on the **Cancel** button.
